PROFESSIONAL BIO-ACTIVE SILVER HYDROSOL **ARGENTYN 23® (23 PPM)**
CANNOT CAUSE ARGYRIA, A BENIGN BLUISH-GREY DISCOLORATION OF THE SKIN

There has been much media attention recently about colloidal silver possibly causing a bluish-grey discoloration of the skin. This benign cosmetic condition is known as Argyria, and is often thought to be irreversible. Argyria can result from the consumption of silver products containing impurities, such as salts and proteins, which form silver compounds that cannot be eliminated easily from the body. These are most commonly found in poorly made colloidal silver products, especially those that are homemade and/or of much higher concentrations (ppm).

I have examined and used Natural-Immunogenics Corp's products and found them to be extremely pure, safe and effective in enhancing the immune system and stimulating healthy regenerative events.

The good manufacturing practices and laboratory controls employed by this company to ensure finished product safety and efficacy are parallel, if not superior, to the practices at the Food & Drug Administration (FDA) and major pharmaceutical companies.

I support and applaud Natural Immunogenics Corp for their attention to safety and quality in making excellent bio-active silver hydrosol products for professional use. It is my researched and professional opinion that there is no reason for concern about the safe usage of their products, when used as directed.
